

# DAX Measures Documentation

## Marketing Campaign Performance Analytics Dashboard

### Overview

This document summarizes the primary DAX measures used to build the Power BI dashboard. These measures calculate key marketing KPIs and support interactive reporting.

| Measure           | Sample DAX Formula                           | Purpose                                                                       |
|-------------------|----------------------------------------------|-------------------------------------------------------------------------------|
| Total Spend       | SUM('Marketing'[Spend])                      | Calculates total campaign expenditure.                                        |
| Total Leads       | SUM('Marketing'[Leads])                      | Calculates total leads generated.                                             |
| Total Clicks      | SUM('Marketing'[Clicks])                     | Calculates total clicks.                                                      |
| Total Impressions | SUM('Marketing'[Impressions])                | Calculates total impressions.                                                 |
| CPC               | DIVIDE([Total Spend],[Total Clicks],0)       | Cost Per Click.                                                               |
| CPL               | DIVIDE([Total Spend],[Total Leads],0)        | Cost Per Lead.                                                                |
| CTR               | DIVIDE([Total Clicks],[Total Impressions],0) | Click Through Rate.                                                           |
| Conversion Rate   | DIVIDE([Conversions],[Total Clicks],0)       | Conversion Rate (adjust to your model if conversions are tracked differently) |

### Notes

- Replace the sample table name **'Marketing'** with your actual Power BI table name.
- If your dashboard uses different measure names, update the formulas accordingly.
- Keep measures in a dedicated Measures table for better model organization.
- Use DIVIDE() instead of the '/' operator to safely handle divide-by-zero scenarios.
